**PROBLEM TO BE SOLVED:** To obtain a new gene coding a chimeric protein containing an extracellular domain of c-MPL and a cell membrane-penetrating through type proteins other than the domain and used for treating aplastic anemia, malignant tumor, thrombocytopenia, etc. **SOLUTION:** This new gene codes a chimeric protein containing an extracellular domain of c-MPL or its part and a cell membrane-penetrating through type protein or its part and is useful for producing the chimeric protein necessary for preparation of c-MPL ligand agonist antibody and the antibody and the protein are effective for chemotherapy of aplastic anemia, malignant tumor, etc. and treatment of thrombocytopenia accompanied by radiotherapy and thrombocytopenia accompanied by bone marrow transplantation. The DNA is obtained by extracting mRNA from HEL 92.1.7 cell, synthesizing its cDNA, cloning the cDNA by PCR method using a primer and binding the resultant DNA of extracellular domain of c-MPL to DNA of interleukin-2 receptor, etc.
